**Comparison of different oil drift models and
different ocean forcing fields with observed
drifter trajectories in the Mediterranean**

Göran Broström and Many Others

Presented at EuroGOOS Meeting, Exeter, May 2008

MERSEA oil spill: Who

Thanks to our coworkers!

- Météo-France (MF): Pierre Daniel, Denis Paradis, David Ayache, Patrick Lelay and Valérie Ulvoas; Stephane Law Chune, Yann Drillet and Gaetan Vinay (Mercator)
- Oceanography Centre, University of Cyprus (OC-UCY): George Zodiatis, Robin Lardner, Xenia Panayidou, Georgios Georgiou, Tom Eleftheriou and Dan Hayes.
- Norwegian Meteorological Institute (met.no): Bruce Hackett, Gøran Brostrøm, Ana Carrasco, Aicha Bounaim, Arne Melsom, Reinoud Bokhorst and Øyvind Breivik.

Also special thanks to:

- Francois Parthiot (CEDRE), Petroula Louka (HNMS), Michela De Dominicis (INGV), Nadia Pinardi (INGV), Massimiliano Drudi (INGV), Thomas Loubrieu (Ifremer), Tony Jolibois (CLS), Matthieu Le Gall (TechWorks)

MERSEA oil spill: What

- **Aim:** Show that the use of Mersea ocean data products as forcing can improve operational oil spill fate forecasting services, by:
 - improving the forecast **accuracy** of existing services
 - extending the **reach** of existing services
local → regional → global longer time horizon
 - leading to new types of forecast **products**
(e.g., multimodel ensemble)

Drift of oil spill:

- Parameterization based on observations
 - Drifts with say 2-3% of wind speed with a 0-20° deflections
 - Simple, reliable
 - May not cover all situations
 - MOTHY model from Meteo France
 - Uses a combination of wind induced drift and ocean currents at 100 m.
 - MEDSLIK model from OC-UCY
 - Uses a combination of wind induced drift and ocean currents at 50 m.
- Full model
 - Requires full ocean model
 - Ocean currents
 - Wave properties (Stokes drift)
 - Complicated
 - Have a wide range of applications
 - OD3D oil drift model met.no
 - Uses modelled ocean currents
 - Stokes drift from wave model

Importance of buoy:

Importance of wave induced drift
Perrier et al 2003, JPO, 2126

FIG. 12. As in Fig. 11 but a comparison between observed drift for buoy 23549 and model estimates for the ocean model only (*without* Ekman layer or wave-induced currents), with Ekman layer currents (labeled “without wave”), and with wave-modified Ekman layer currents (labeled “with wave”).

Data needed to force the OD3D model

<i>Wind speed</i>	U_{10}, V_{10}	<i>Fields (GRIB or netcdf)</i>
Wave parameter (analysed)	U_{st}, V_{st}	<i>Fields (GRIB or netcdf)</i>
Wave parameter	H_{sig}, T_p	<i>Fields (GRIB or netcdf)</i>
Sea surface temperature	SST	<i>Fields (GRIB or netcdf)</i>
Ocean surface current	U, V	<i>Fields (GRIB or netcdf)</i>

Preferably acquired using OPeNDAP using a single script that always works!

Mersea experiment - Overview

Western Mediterranean
7 drifters

Eastern Mediterranean
3 drifters

Schematic description of Mediterranean circulation

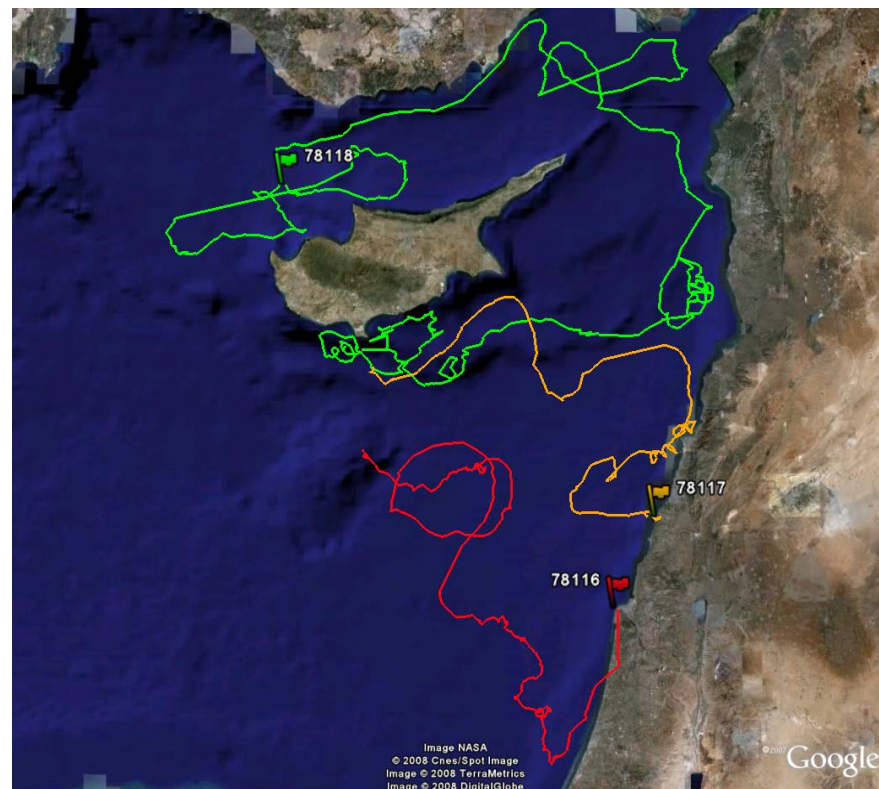

Mersea experiment - Overview

Western Mediterranean

Eastern Mediterranean
3 drifters

Western Med - Overview

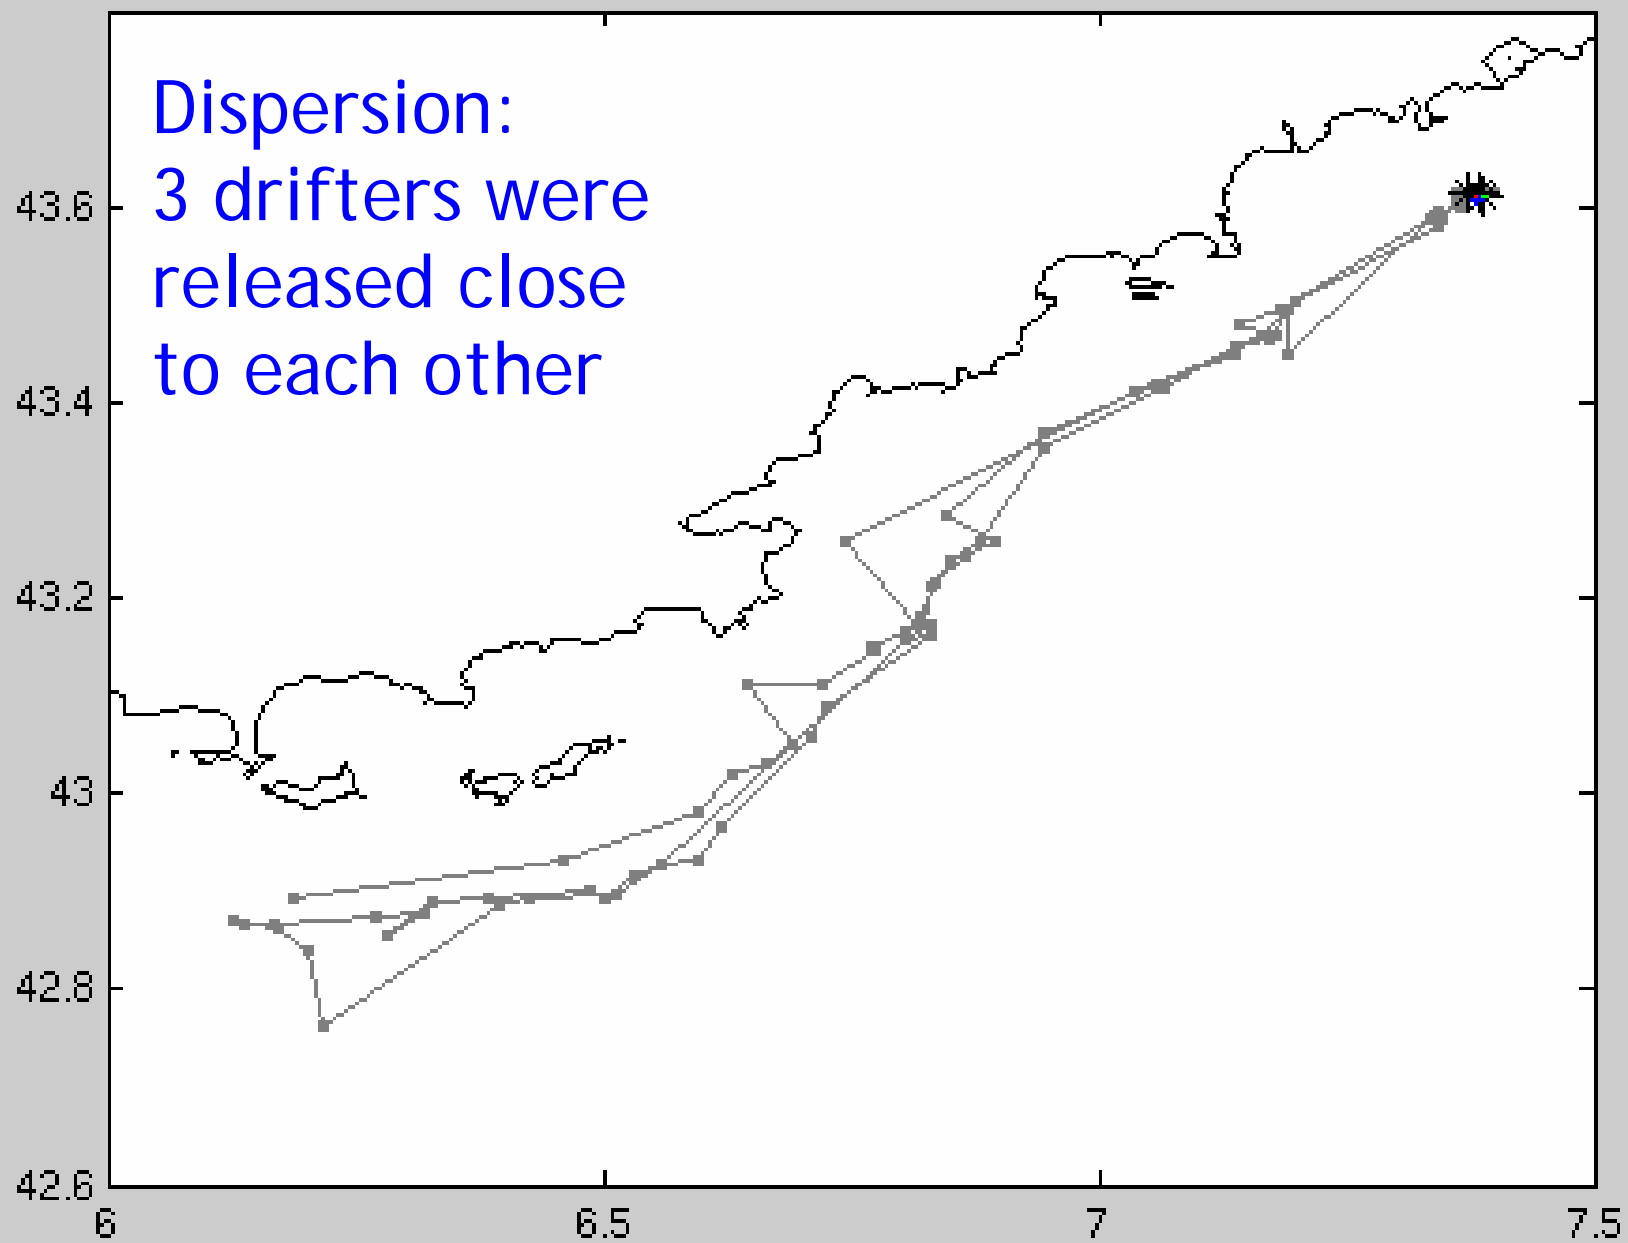

*surface buoys
used in the
Western Med
experiment*

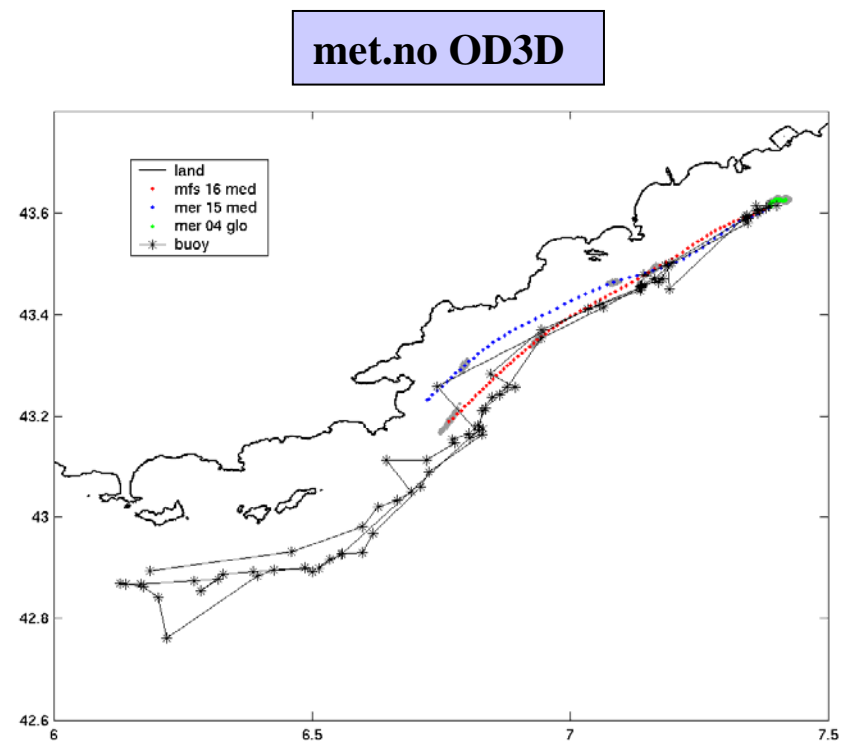

Western Med – Forcing

- met.no
 - ECMWF global wind
 - ECMWF global wave fields
 - Mercator or MFS ocean currents
- Meteo France
 - ECMWF global wind
 - Mercator, MFS or climatological ocean currents

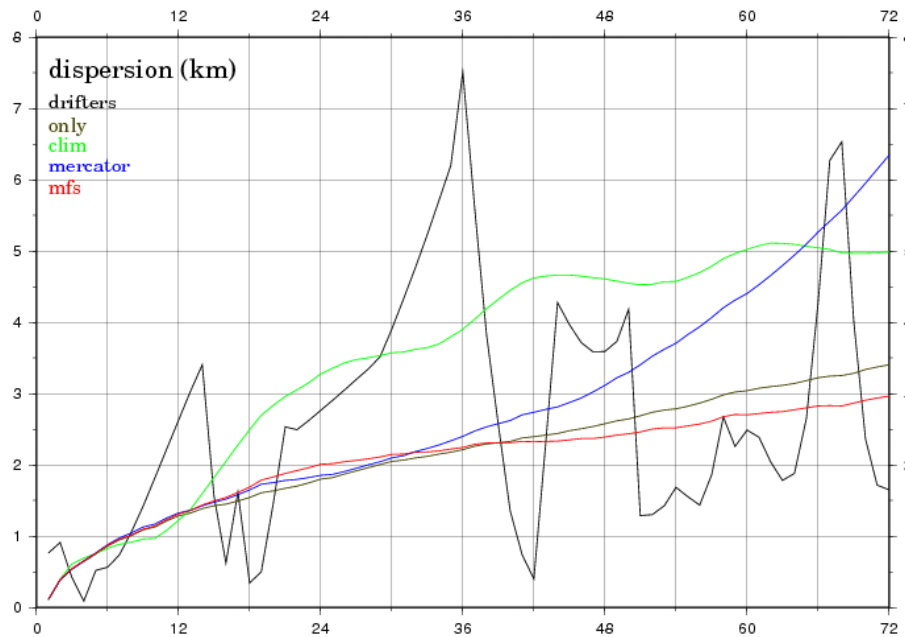

West Med - Forecasts vs. drifters

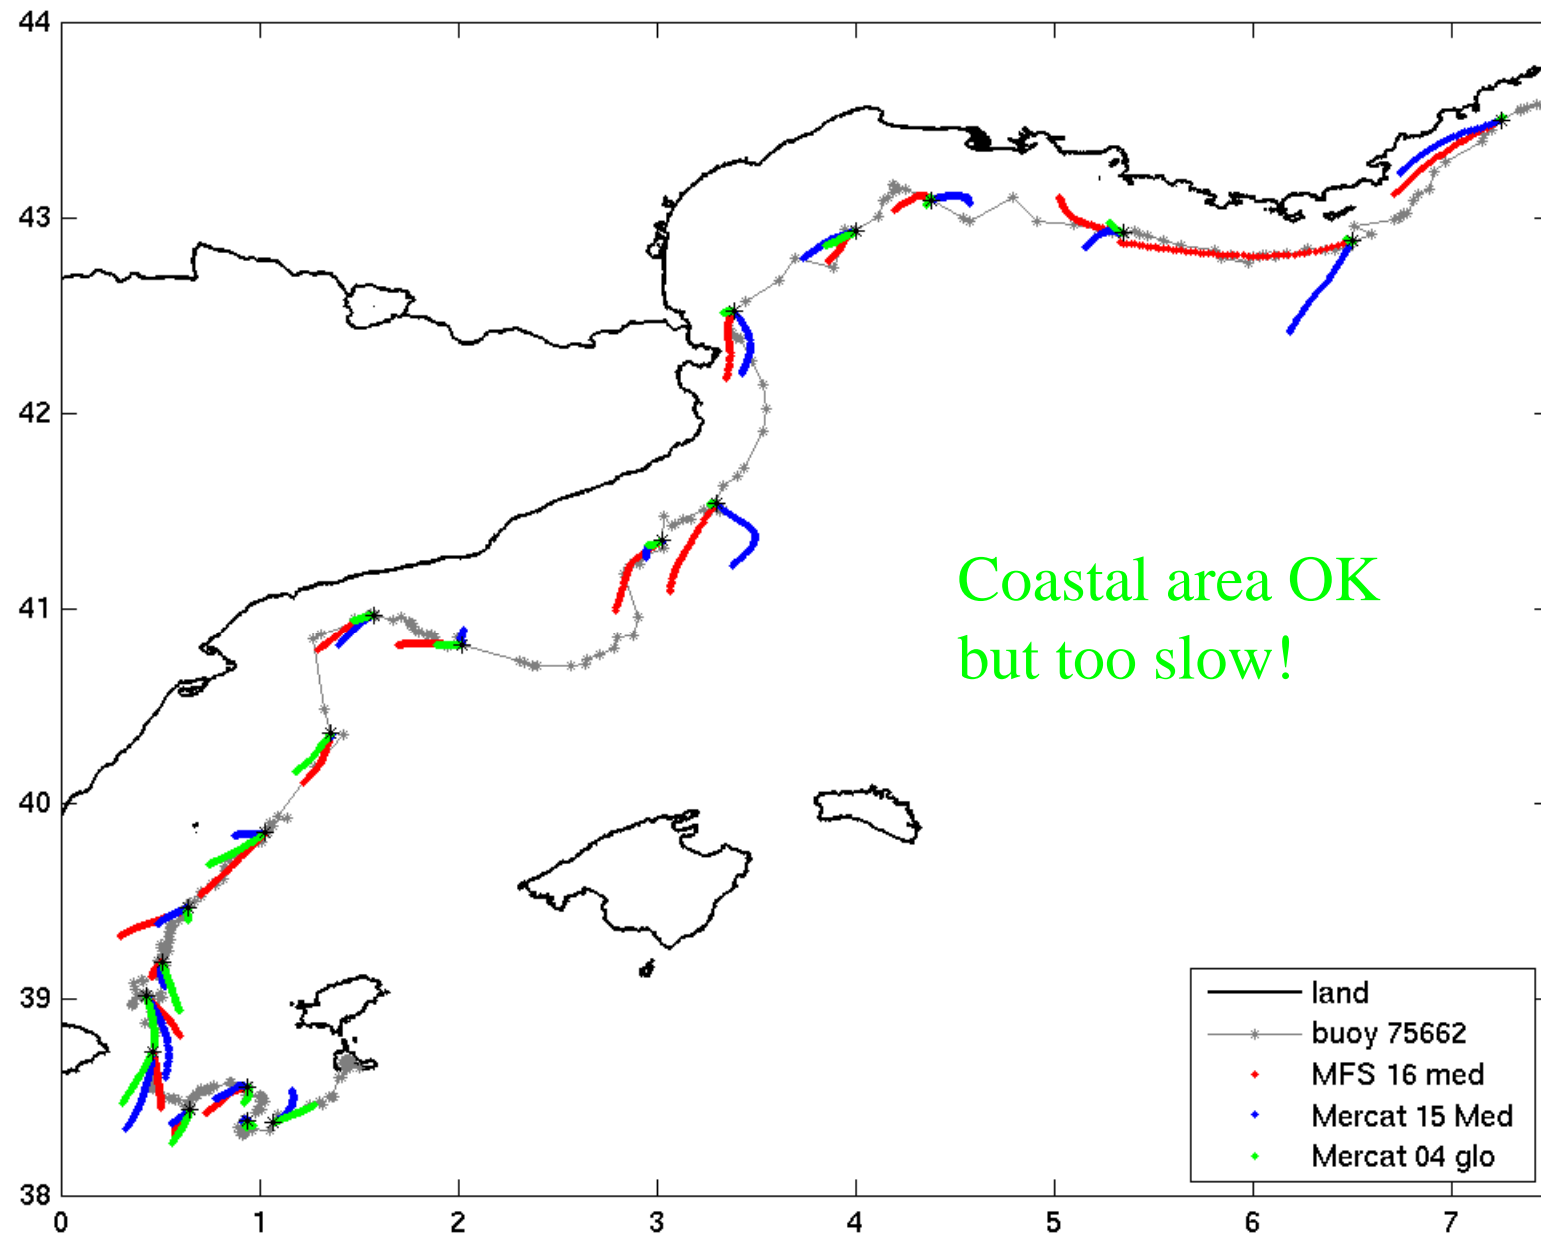

Forecasts (colors) using various ocean forcing data.

West Med - Dispersion

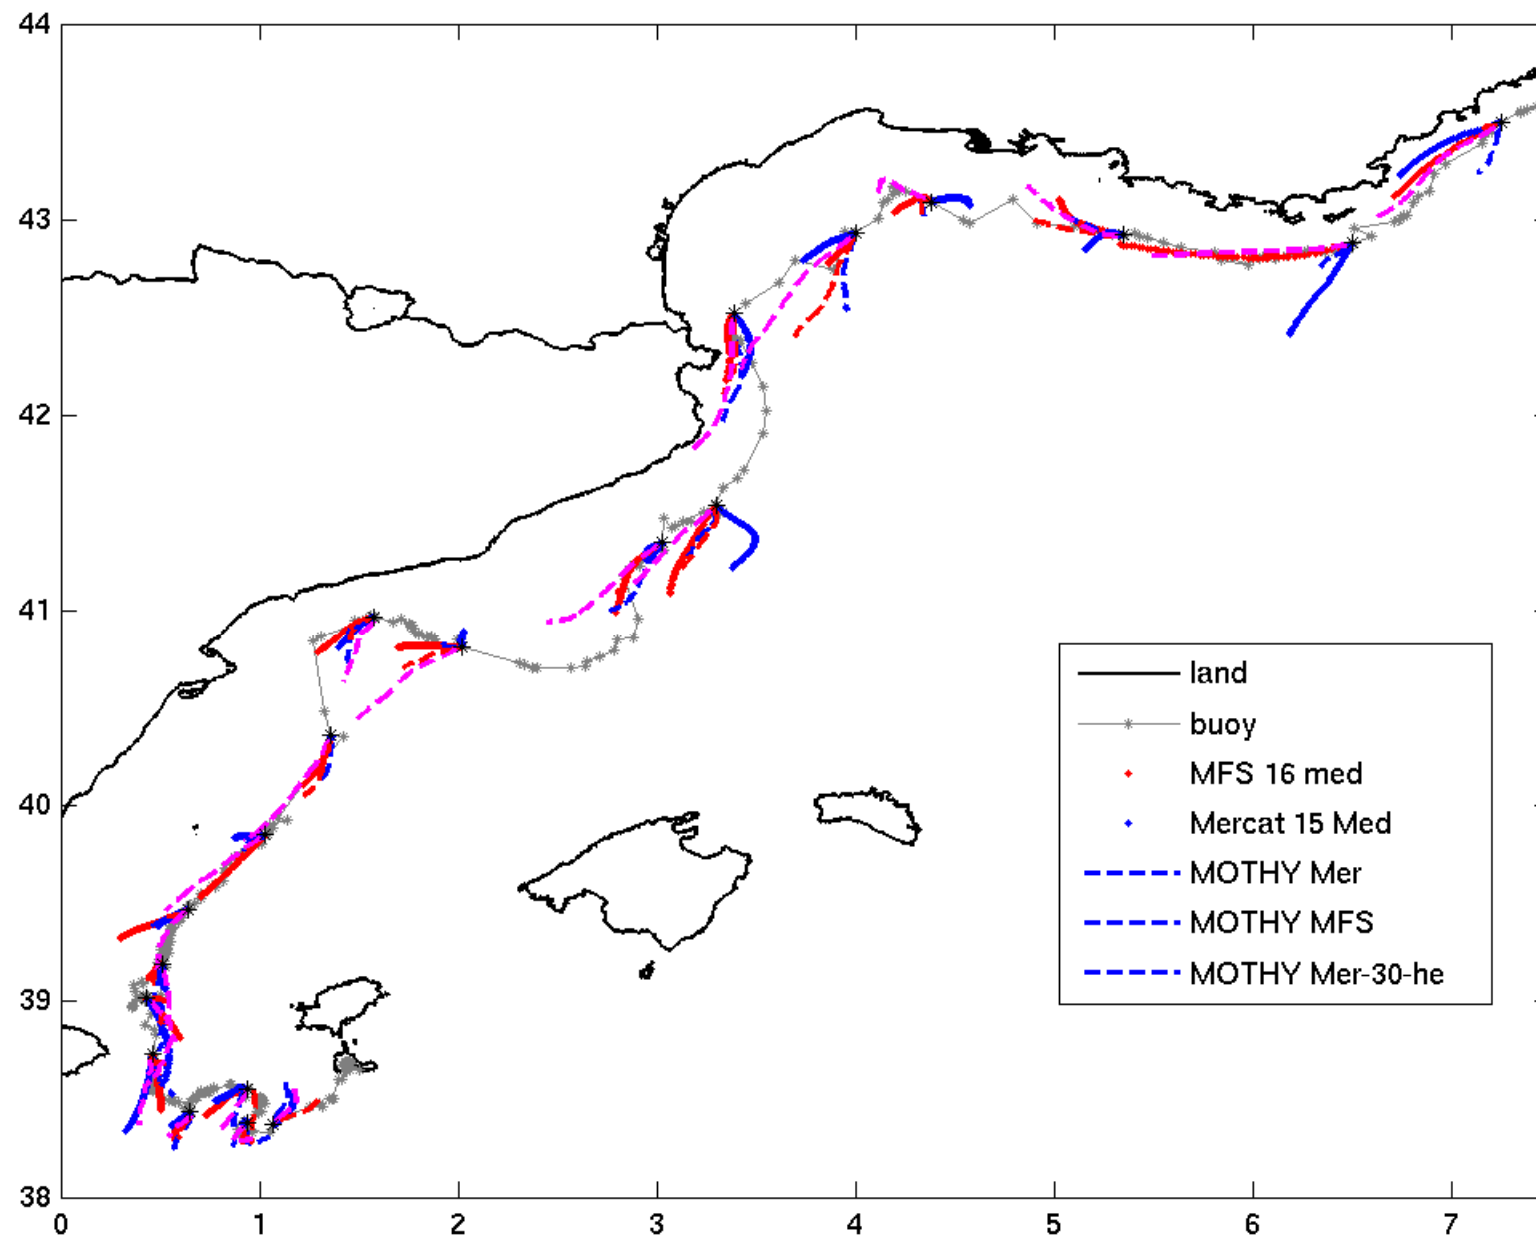

$$rms_{accuracy} = \sqrt{\left(\bar{x}(t) - \overline{x_d}(t)\right)^2 \cos^2(\bar{y}(t)) + \left(\bar{y}(t) - \overline{y_d}(t)\right)^2}$$

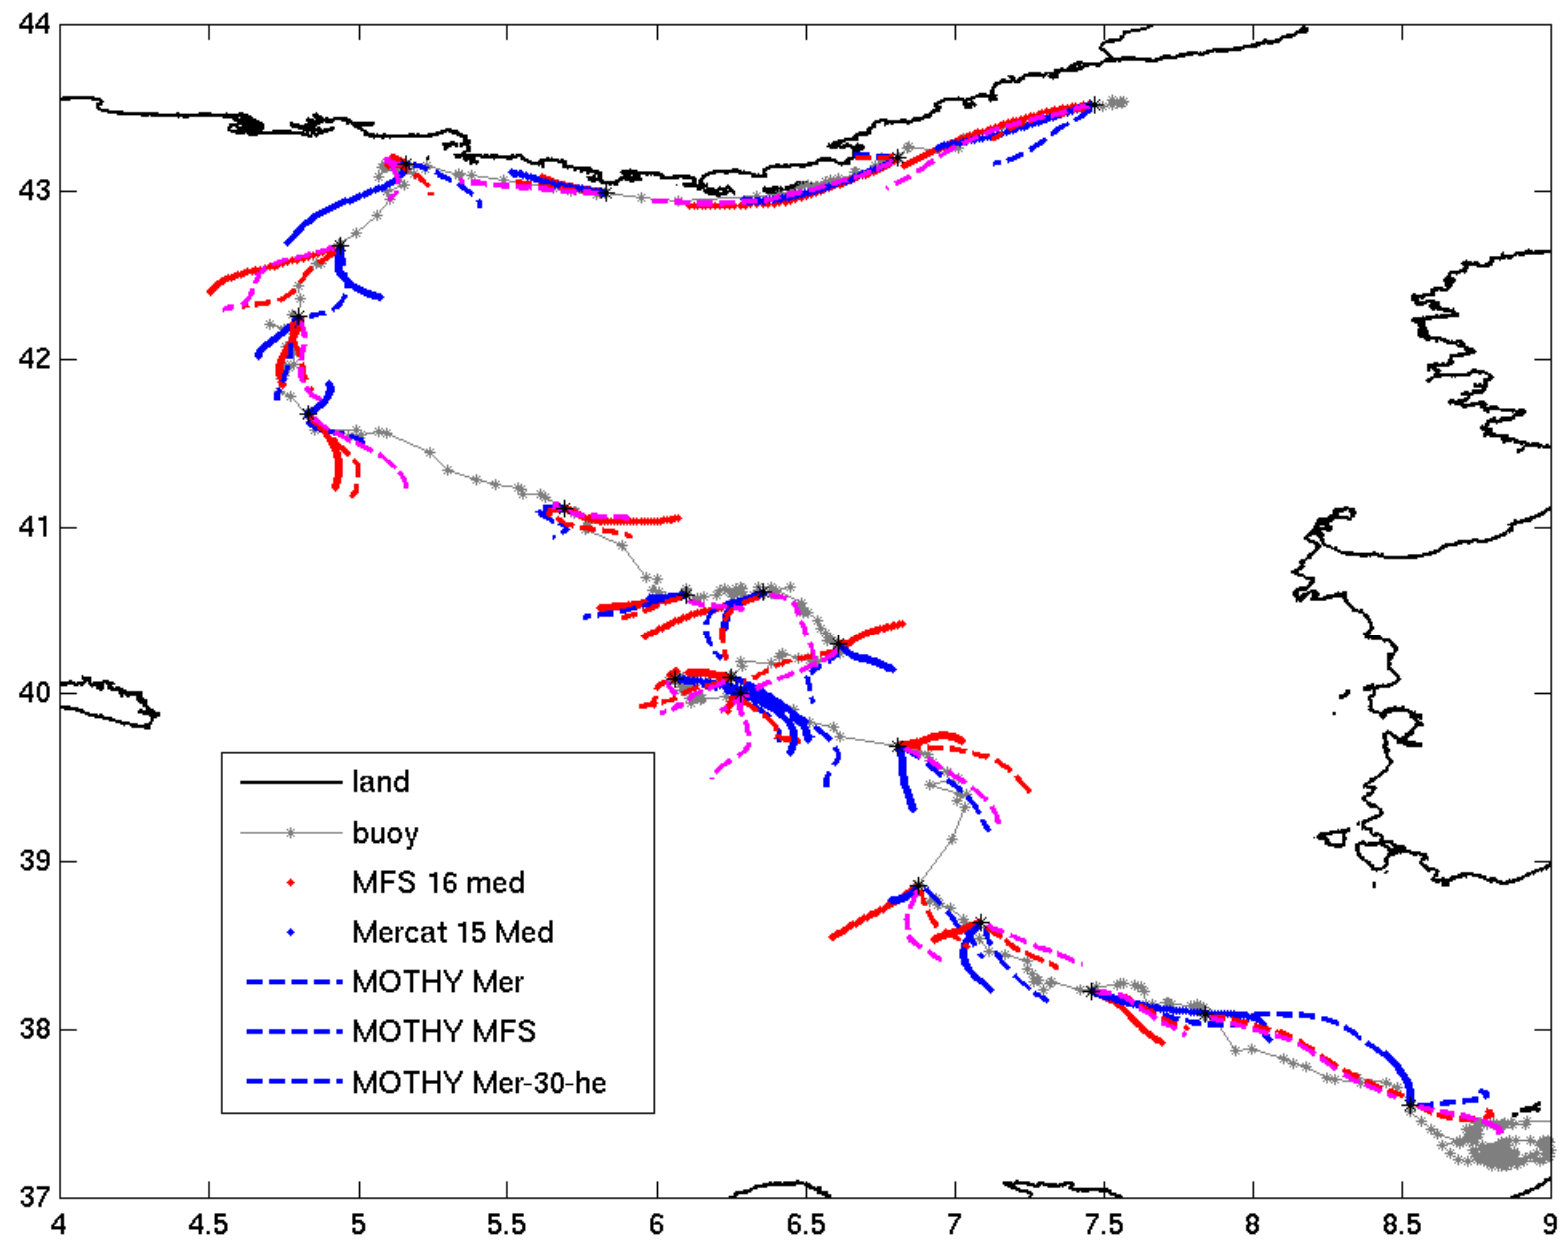

Results from MOTHY and OD3d models using same forcings

DEMO Western Med - Performance

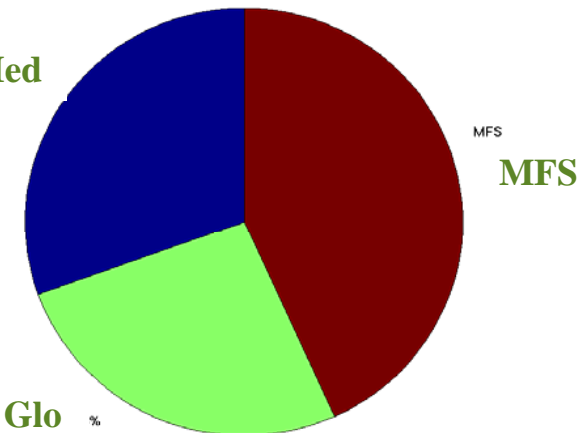

MF MOTHY

met.no OD3D

Merc Med

Merc Glo

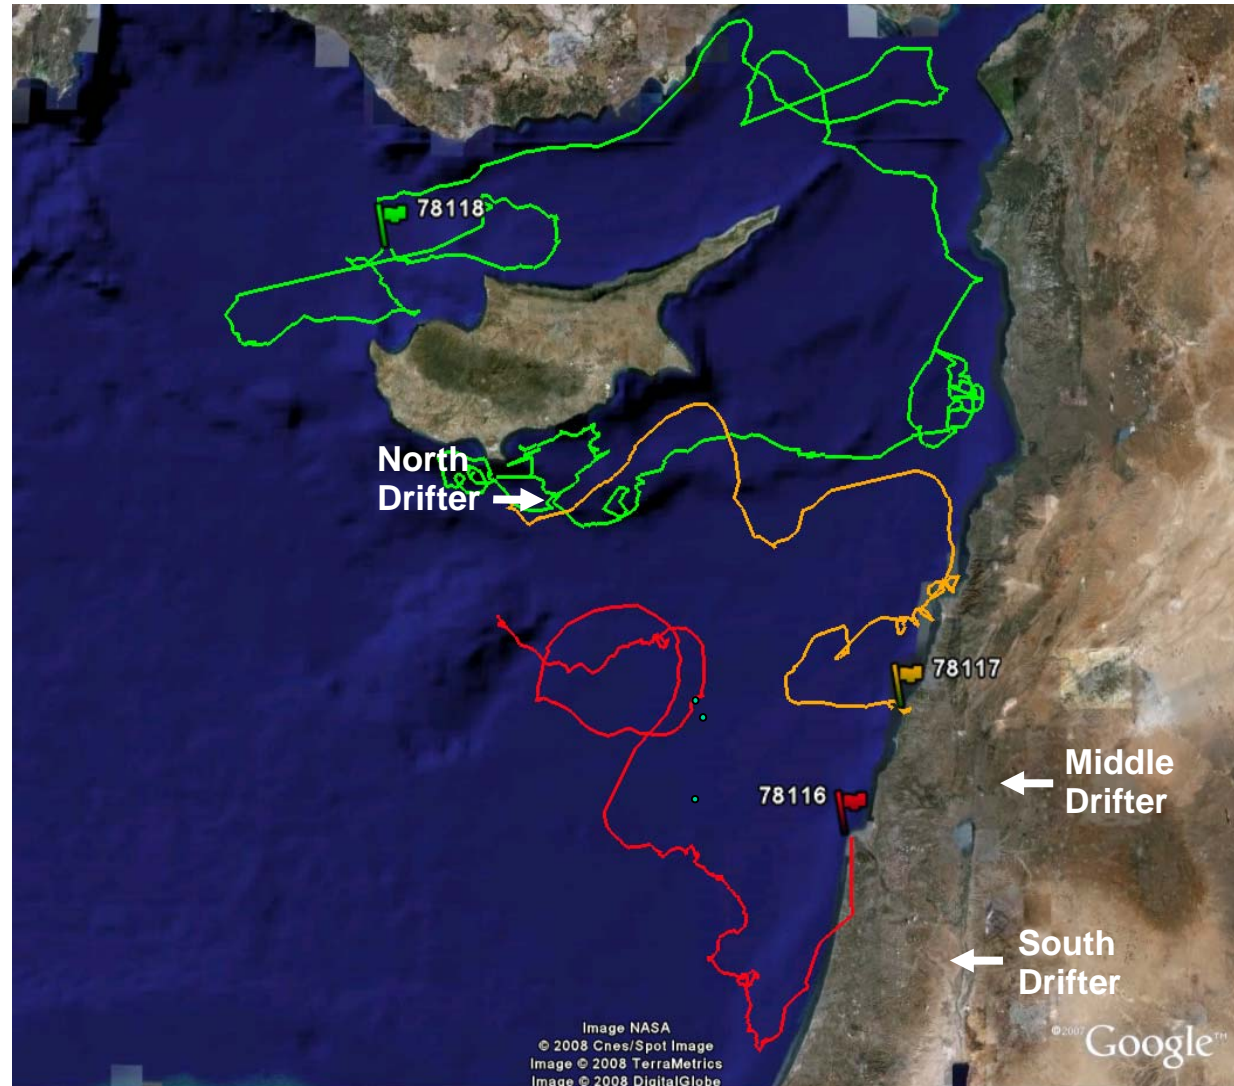

“Winners” of the consecutive forecasts.

Eastern Med - experiment

Time schedule: 3 drifters were deployed, 17 Sept until 26 Dec 2007

Argosphere oil-emulating surface drifters used in the E. Med experiment

DEMO Eastern Med - OC-UCY forecasts

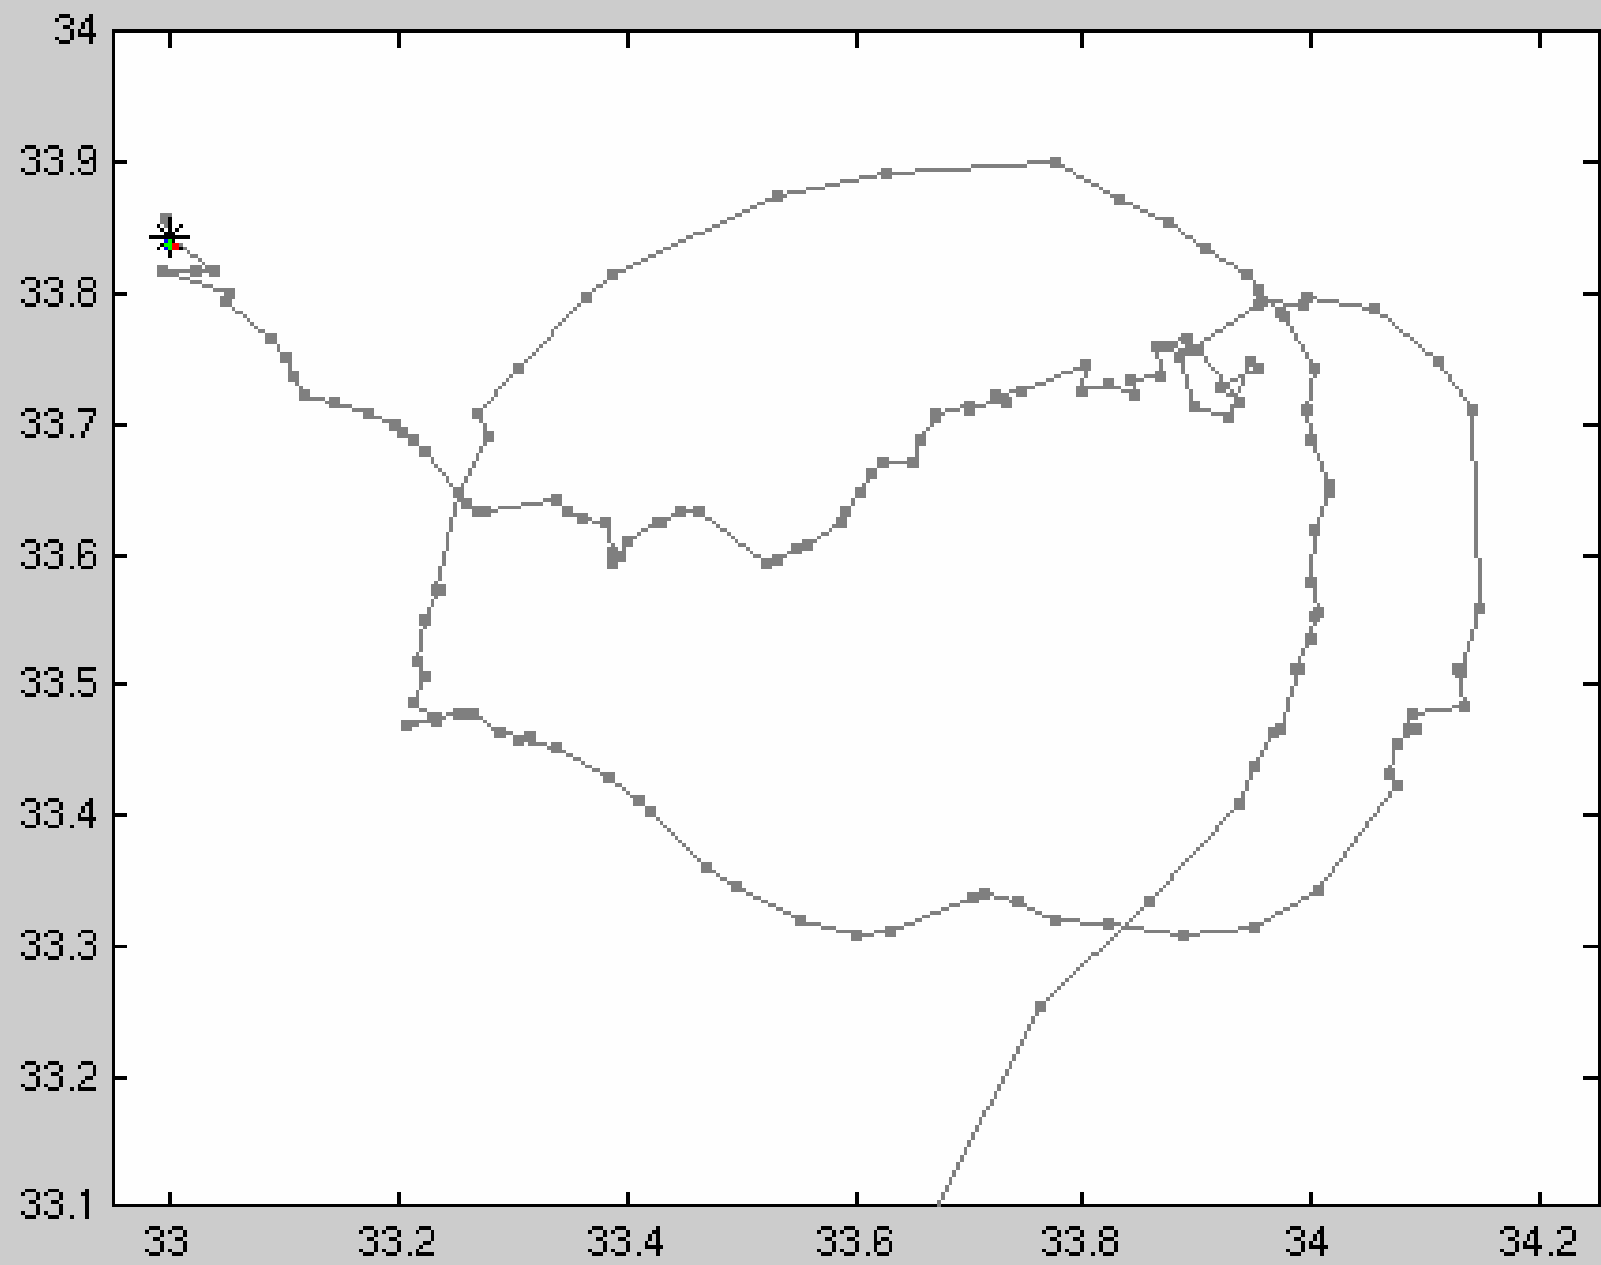

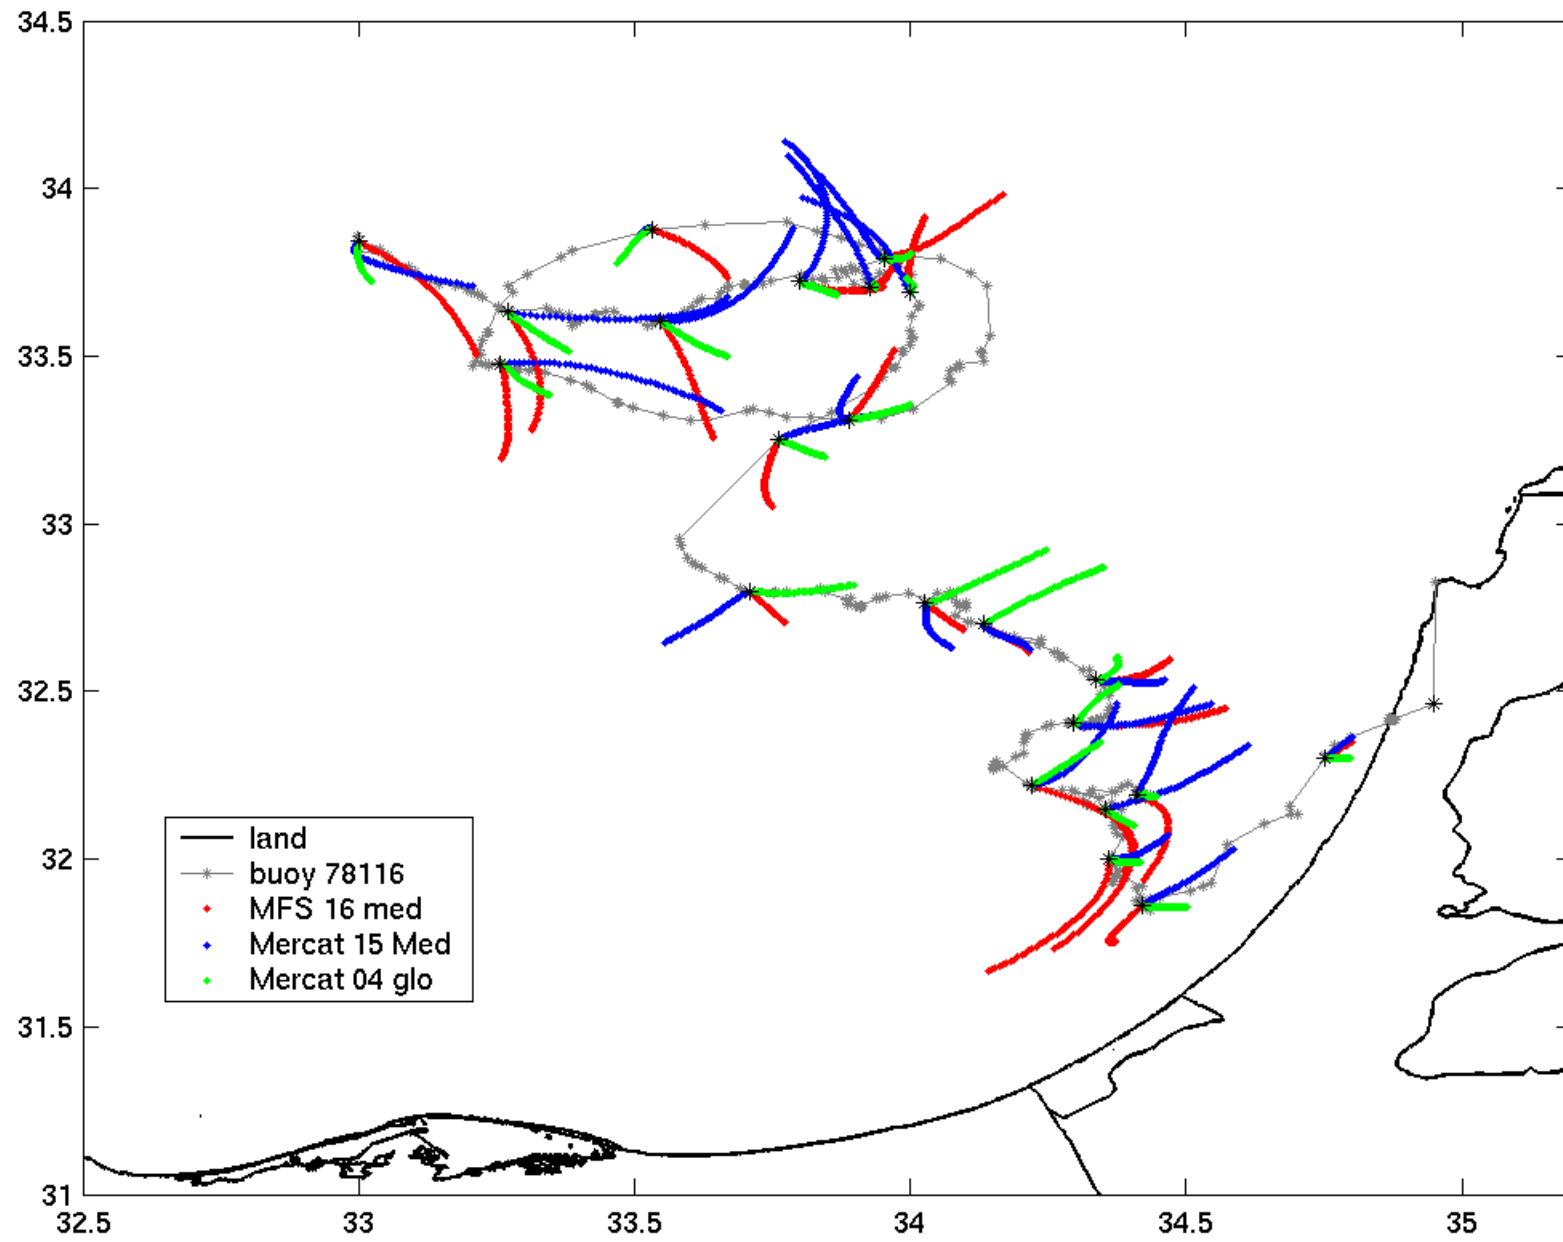

MEDSLIK forcing: CYCOFOS nested in MFS; SKIRON winds

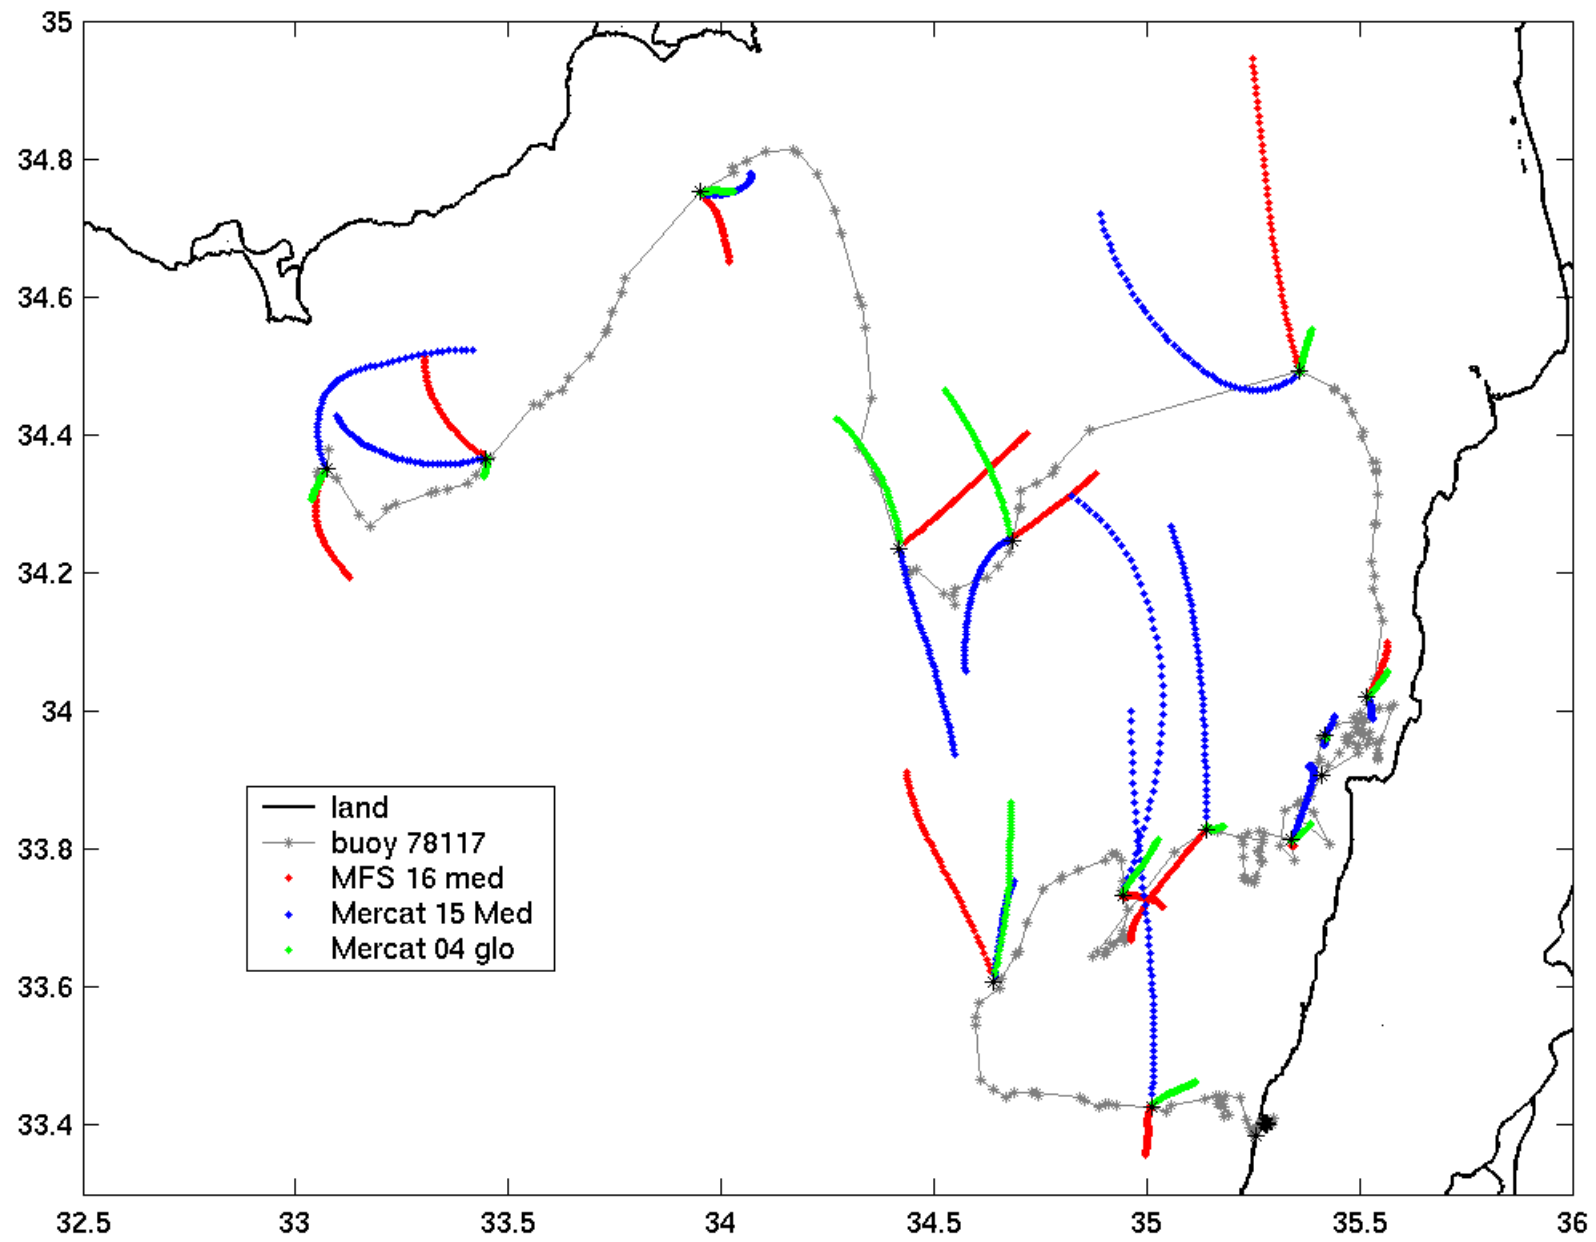

Drifters - red
Forecast - white
First 8 days

Only forecasts for
Middle and South
are shown

Real case example

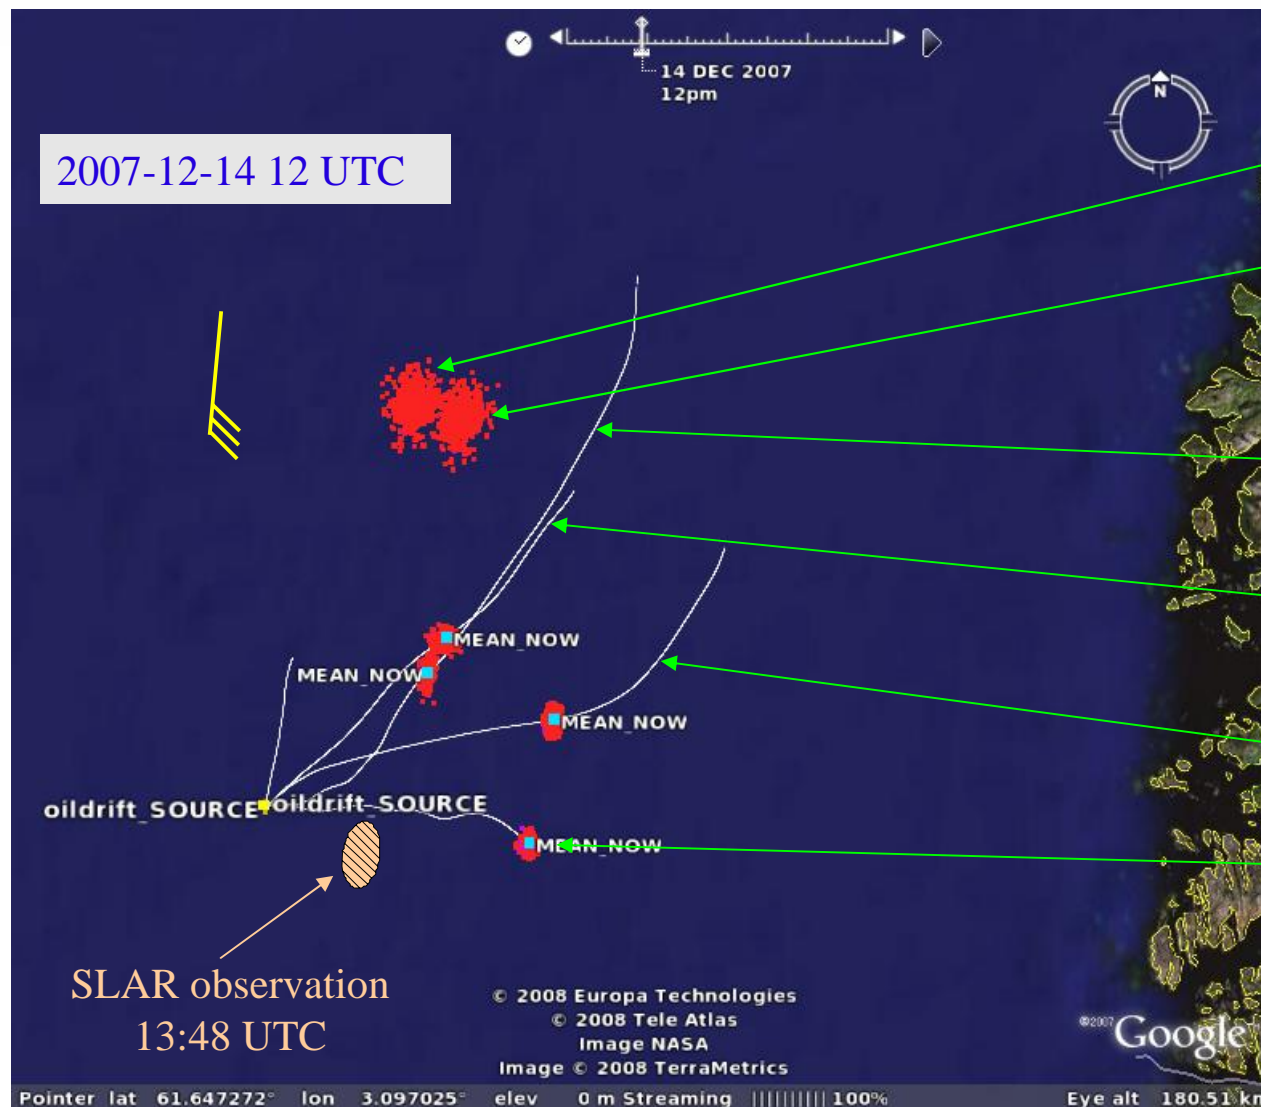

- Statfjord A accident
 - Dec. 12, 2007
 - 4000 m³ oilspill
 - Oil drift trajectories were done within 2 h of the accident (met.no within 30 min from calls from authority)
- Mersea demonstration
 - met.no
 - Own model data
 - MERCATOR global
 - Meteo France
 - MERCATOR North Atlantic

OffshoreLoadingSystem (OLS, Statfjord)

DEMO Statfjord - Results

met.no
(Mercator NAT)

met.no
(Mercator global)

met.no (Nordic4)

Conclusions

- Different model formulations give very different results on trajectory
 - MOTHY and OD3D has about same performance.
- Models based on MERSEA products
 - are relatively good in coastal areas
 - do not perform well in open ocean
- Wave drift is most likely important to account for in strong forcing conditions

END
